EXPERIENCE

Intern, Machine Learning

Jan 2026 – present

Tenstorrent, building computers for AI

Santa Clara, CA

- Implemented a finetuning pipeline of the TinyLlama model on the GSM8K middle-school math problems, boosting accuracy from 19% to 34%.
- Bringing up an asynchronous reinforcement learning framework in the open source tt-metal repository, supporting token generation concurrently with the weight transfer.
- Debugging cross-accelerator communication issues causing deadlocks, coordinating with teams across the company to resolve them.

Junior C++ Developer

July 2022 – July 2023

Keepit; a backup solution for cloud services

Krakow, Poland

- Launched Azure Devops backup coverage working with 3 teammates over the course of 12 months.
- Collaborated with QA and Customer Support teams, provided technical documentation, presented projects to stakeholders.
- Developed an item upload scheduling algorithm, enabling restore of snapshots with up to 10 million dependencies.
- Refactored parts of C++20 development and Java 8 testing code, unified JSON parsing approach.

TECHNICAL SKILLS

Languages: Python, C++, Go, Java

Other: Git, GDB, CMake, Linux

EDUCATION

University of Toronto

Graduating in June 2028

Computer Science Major, Mathematics Major, Coop student

GPA: 3.67

Relevant coursework:

- CSC369 – Operating Systems (78%)
- MAT237 – Advanced Calculus (86%)
- CSC265 – Enriched Data Structures and Analysis (91%)

PROJECTS

rm-exporter

- Found limitations of note export on the reMarkable tablet (inability to select folders and export large notes).
- Developed an open-source GUI export client from scratch using Go, Typescript, Svelte.
- Addressed community feedback by fixing issues and adding functionality, achieved 670 downloads and 45 stars on the Github repository.

game-of-life

- Wrote a robust implementation for Conway's Game of Life mathematical simulation in Rust, Javascript, WebAssembly, ensuring memory safety and multiplatform support.
- Optimized time usage by using Hashlife high-performance algorithm and running it on a separate thread, allowing to render millions of state updates per second.
- Shared technical details by writing an explanation blog and implementing integration tests.

food-classifier

- Researched various machine learning models to classify a food item based on survey answers.
- Implemented final prediction script in Python in a team of 4 people across 2 months.
- Wrote a report in a team describing hyperparameter tuning and choosing a final model.
- Achieved 86% testing accuracy on the instructor's data, team rank 5 out of 65.
