EXPERIENCE

Intern, Machine Learning

Jan 2026 – present

Tenstorrent, building computers for AI

Santa Clara, CA

- Brought up a fully asynchronous reinforcement learning framework for Tenstorrent hardware.
- Achieved a 19.4x speedup in per-step training time by implementing concurrent weight updates, token generation, weight transfer.
- Finetuned Qwen3-0.6B-Base on middle-school math problems, boosting accuracy from 25.6% to 40.6%.
- Profiled token generation performance in Tenstorrent training framework, identified a host dispatch overhead causing 7x slowdown.
- Debugging cross-accelerator communication issues causing deadlocks, coordinating with teams across the company to resolve them.

Firmware Developer

May 2025 – Jan 2026

University of Toronto Aerospace Team

Toronto, ON

- Contributed to the FINCH satellite firmware, reviewed pull requests, presented findings to the team.
- Led the migration of Zephyr development environments for 10+ team members to Docker, ensuring multiplatform support (Linux, Mac, Windows).
- Achieved 2x speedup of an image compression algorithm by applying general performance optimizations.

Junior C++ Developer

July 2022 – July 2023

Keepit; a backup solution for cloud services

Krakow, Poland

- Launched Azure Devops backup coverage working with 3 teammates over the course of 12 months.
- Developed an item upload scheduling algorithm, enabling restore of snapshots with up to 10 million dependencies.
- Refactored parts of C++20 development and Java 8 testing code, unified JSON parsing approach.

TECHNICAL SKILLS

Languages: C++, Python, Go, Java, Rust

Other: GDB, Tracy, CMake, Git, Linux, Docker

EDUCATION

University of Toronto

Graduating in January 2028

Computer Science Major, Mathematics Major, Coop student

GPA: 3.67

Relevant coursework:

- STA257 – Probability and Statistics I (93%)
- MAT237 – Advanced Calculus (86%)
- CSC265 – Enriched Data Structures and Analysis (91%)

Competitive programming:

- Peak Codeforces rating: 1909 (Candidate Master), active until 2021.
- Ukrainian Olympiad in Informatics: national finalist, peak top 20 (2020).

PROJECTS

game-of-life

- Wrote a robust implementation for Conway's Game of Life mathematical simulation in Rust, Javascript, WebAssembly, ensuring memory safety and multiplatform support.
- Optimized time usage by using Hashlife high-performance algorithm and running it on a separate thread, allowing to render millions of state updates per second.
- Shared technical details by writing an explanation [blog](#) and implementing integration tests.

rm-exporter

- Built an open-source GUI export client (Go, TypeScript, Svelte) for the reMarkable tablet, addressing folder selection and large-note export gaps in the official app.
- Addressed community feedback by fixing issues and adding functionality, achieved 815 downloads and 46 stars on the Github repository.
